## **1. INTRODUCTION**

### **1.1 Project Overview**

Bike share programs have risen in popularity in recent years and have been promoted as a lower carbon alternative to other forms of transit. Interest in bicycle sharing has been growing exponentially over the past decade, resulting in a proliferation of bike share systems in 712 cities across the world, encompassing 806,000 bicycles and 37,500 stations. This can be largely attributed to the successful incorporation of information technology in docking stations and mobile devices as well as improved logistics such as bicycle rebalancing to ensure responsive supply management. Cities often hope bike sharing will bring many benefits such as extending the reach of transit, substituting motorized trips, and encouraging non-cyclists to try cycling.

The premise of bicycle sharing is that it is a short-term bike rental system, based on varying timed memberships. Members of the bike share network have access to stations, consisting of a pay-station and multiple bike docks, across the system where bikes can be checked out from one station and returned to another nearest to their destination. The appeal of membership is 24/7 access to an automated bike rental network and utility of bikes in completing “last-kilometer connections” without the worry of storage or maintenance. The price system is set to encourage shorter trips (less than 30 minutes in time), with additional fees for any time used over that maximum.

There is evidence that bike share users switch to bike share from motorized transport, such as bus and auto, creating the potential for significant reductions in transportation related greenhouse gas or CO<sub>2</sub>e emissions. However, there is significant heterogeneity between different cities, showing that there is not a guaranteed CO<sub>2</sub>e reduction benefit

from instituting bike share, especially if the trips would not have been made otherwise or are substituting walking and private bicycle trips.

## **1.2 Purpose**

The purpose of this analysis is to create an operating report of Citi Bike for the year 2018. From this analysis, the following data visualizations will be created.

- 1.Total Number of Trips
- 2.What is Customer and subscriber with gender
- 3.Find the top bike used with respect to trip duration?
- 4.Calculating the number of bikes used by respective age groups.
- 5.Top 10 Start Station Names with respect to Customer age group

## **2. LITERATURE SURVEY**

### **2.1 Existing Problem**

Spinlister - Spinlister is an online hub for renting bikes from individuals or bike rental shops.

Zagster - Life is better on a bike! They are bringing bike share to communities across the USA.

Motivate International - Motivate is a global full-service bike share operator and technology innovator.

Spin - Spin is a stationless bike and electric scooter sharing service.

### **2.3 Problem statement Definition**

In busy cities like New York the people are facing difficulties in analyzing the demand for bikes during peak hours.

The main objective of this project is to predict bike patterns that will be extremely helpful for people to plan their travel.

### **3. IDEATION & PROPOSED SOLUTION**

#### **3.1 Empathy Map Canvas**

#### **3.2 Ideation and Brainstorming**

## Step-2: Brainstorm, Idea Listing and Grouping

3

### Brainstorm as a group

Have everyone move their ideas into the "group sharing space" within the template and have the team silently read through them. As a team, sort and group them by thematic topics or similarities. Discuss and answer any questions that arise. Encourage "Yes, and..." and build on the ideas of other people along the way.

🕒 15 minutes

#### TIP

You can use the Meeting session tool above to focus on the strongest ideas.

On each trip a bike is picked up at one station and dropped off at another. When a bike is picked up there's one less bike at the start station; when it's dropped off there's one more bike at the end station.

To represent this activity I start by reading a tripdata file for one month. I split it into two dataframes: one for pickups and end one for drop-offs.

The number of bikes in the station at the beginning of the month is unknown.

It doesn't take into account rebalancing, bikes removed for maintenance or those added to the system.

## 3.3 Proposed Solution

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	People are unaware of the system and effects during bad weather conditions, Bike demands during peak hours.
2.	Idea / Solution description	Analysing the bike usage, no of trips, and the usage based on customer and subscriber's gender and age categories
3.	Novelty / Uniqueness	Understanding ,Exploring by creating data visualization by prediction of bike utilization,demand. 1.Overcome the Problem of Empty bicycle stations 2. Popular times of travel a. most common month b. most common day of week c. most common hour of day 3. Popular stations and trip a. most common start station b. most common end station c. most common trip from start to end
4.	Social Impact / Customer Satisfaction	1. Reduced congestion and fuel consumption 2.Transport flexibility 3. Reductions to vehicle emissions 4. Health benefits 5. Financial savings for individuals.
5.	Business Model (Revenue Model)	Having an membership active pass makes the customer can rent bikes with amount packages based on time-constraints per weeks/days. Subscriber can rent bikes with amount packages based on time-constraints per month/year.
6.	Scalability of the Solution	can improve the productivity of citi-bike system, widespread of utilization according to the customer's demands.

## 3.4 Problem Statement Fit

Define CS, fit into CC	<b>1. CUSTOMER SEGMENT(S)</b> <span>CS</span> Who is your customer? i.e. working parents of 0-5 y.o. kids <ul style="list-style-type: none"> <li>- Sales team of Citi</li> <li>- Marketing team of Citi</li> <li>- Firms looking to start a new bike sharing system</li> </ul>	<b>6. CUSTOMER CONSTRAINTS</b> <span>CC</span> What constraints prevent your customers from taking action or limit their choices of solutions? i.e. spending power, budget, no cash, network connection, available services <ul style="list-style-type: none"> <li>- Lack of availability of data obtained through detailed data analysis of available information pertaining to the bike sharing system</li> <li>- Limited access to statistical information</li> </ul>	<b>5. AVAILABLE SOLUTIONS</b> <span>AS</span> Which solutions are available to the customers when they face the problem or need to get the job done? What have they tried in the past? What pros & cons do these solutions have? i.e. pen and paper is an alternative to digital contacting Surveys and studies to understand the active user age groups, frequently visited locations, riding patterns, peak hours etc. Pros: <ul style="list-style-type: none"> <li>- Easy and simple to implement</li> <li>- Direct interaction with the end users of the bike share system</li> </ul> Cons: <ul style="list-style-type: none"> <li>- Limited sample audience - might lead to inadequate understanding</li> <li>- Lack of utilization of all available data</li> <li>- Information collected is hard to extend when needed in the future</li> </ul>	Explore AS, differentiate
	<b>2. JOBS-TO-BE-DONE / PROBLEMS</b> <span>J&amp;P</span> Which jobs-to-be-done (or problems) do you address for your customers? There could be more than one, explore different sides. We create an operating report with various forms of visualisations using huge volumes of Citibike user data. The existing data is filtered to extract the essential information. For eg Finding the number of bikes used by different age groups	<b>9. PROBLEM ROOT CAUSE</b> <span>RC</span> What is the real reason that this problem exists? What is the back story behind the need to do this job? i.e. customers have to do it because of the change in regulations Data Analytics can help find patterns and useful insights using data which is necessary for the Citi bike team to analyze their product delivery system and find areas with scope for improvement	<b>7. BEHAVIOUR</b> <span>BE</span> What does your customer do to address the problem and get the job done? (E.g. Directly related: find the right solar panel installer, calculate usage and benefits; Indirectly associated: customers spend too time in volunteering work (i.e. Greenpeace)) They do not have any insights about gained from user data. Therefore they are unable to promote their product (Citibike) in the best possible way.	

Identify strong TR & EM	<b>3. TRIGGERS</b> <span>TR</span> What triggers customers to act? i.e. seeing their neighbour installing solar panels, reading about a more efficient solution in the news. <ul style="list-style-type: none"> <li>- Realizing how unhealthy they are becoming and finding out using bikes can be healthy - this makes the users use the bikes more often which gives the Citi teams more sales</li> <li>- Realizing how much pollution they are causing by making use of vehicles that give out CO2</li> </ul>	<b>10. YOUR SOLUTION</b> <span>SL</span> If you are working on an existing business, write down your current solution first, fit it in the canvas, and check how much it fits reality. If you are working on a new business proposition, then keep it blank until you fit it in the canvas and come up with a solution that fits within customer limitations, solves a problem and matches customer behaviour. <ul style="list-style-type: none"> <li>- Developing an interactive dashboard that gives various insights about details like finding the number of bikes used by different age groups, etc.</li> <li>- Different visualizations will be displayed on the dashboard for easy analysis. This makes it easier to take business decisions</li> </ul>	<b>8. CHANNELS of BEHAVIOUR</b> <span>CH</span> <b>8.1 ONLINE</b> What kind of actions do customers take online? Extract online channels from #7 <b>8.2 OFFLINE</b> What kind of actions do customers take offline? Extract offline channels from #7 and use them for customer development. <b>ONLINE:</b> The teams at Citi will be able to keep track of the statistics of the usage of Citi bikes online by looking at the dashboards and visualizations.	Identify strong TR & EM
	<b>4. EMOTIONS: BEFORE / AFTER</b> <span>EM</span> How do customers feel when they face a problem or a job and afterwards? i.e. lost, insecure - confident, in control - use this for your communication strategy & design. <ul style="list-style-type: none"> <li>- Users of the bikes will feel extremely satisfied after a good ride which in turn will give the teams at Citi satisfaction</li> <li>- Customers will feel good about giving back to the community by reducing carbon footprint</li> </ul>		<b>OFFLINE:</b> The teams at Citi will be involved in offline work like installing new bike hubs and trying to work off site to find the problems faced by users of the Citi bike. They also try to keep new bikes in stock in all hubs.	

## 4. REQUIREMENT ANALYSIS

### 4.1 Functional Requirement

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	User Registration	Registration through Form Registration through Gmail Registration through LinkedIn
FR-2	User Confirmation	Confirmation via Email Confirmation via OTP
FR-3	Collection of Data	Utilizing the NYC Citi Bike assists in gathering information on the various trips that various users of Citi Bike take. These data were then organised into datasets and made available for further study and visualisation.
FR-4	Analysis of Data	Preprocessing and filtering the provided data in accordance with the sub-requirements task's is part of the analysis process. Data analysis and visualisation are both aided by the use of machine learning algorithms to glean more insights from the data..
FR-5	Display (Visualization) of Data	Various visualisations are used depending on the sub-task being handled. These visualisations are then combined and shown on a dashboard, which is a tool for giving customers business information. Finding the top 10 Start stations according to customer age group and showing the most popular bikes according to trip time are a few of the various sub-tasks included in this requirement.

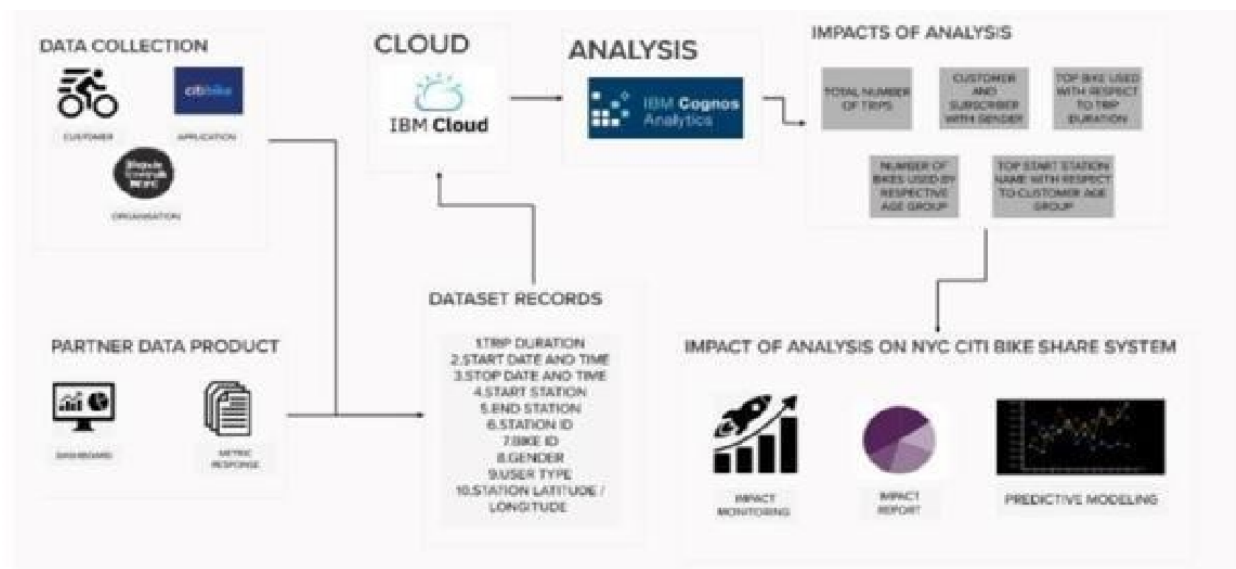

## 4.2 Non-Functional Requirement

FR No.	Non-Functional Requirement	Description
NFR-1	Usability	The dashboard gives users access to an operational report that is simple to read and useful for understanding market trends and company insights. Data can be examined from various angles and in more depth by using an interactive dashboard to drill down and filter operating information.

NFR-2	Security	Based on the Citi Bike utilization data and its analysis, several important business decisions will be made, which will be appropriately secured. Data and visualisation reports are only available to a certain group of clients/users.
NFR-3	Reliability	This research offers a trustworthy and effective way to understand how well this bike-sharing programme performed in 2018. Utilizing the IBM Cognos Platform ensures operational report production, upkeep, and accessibility with industry-standard reliability (dashboard).
NFR-4	Performance	The effectiveness of a bike-sharing system in terms of both its spatial and operational efficiency. In order to increase the operational effectiveness of the bike-sharing system, it is critical to assess the state of bike lanes from the viewpoint of public bike riders. The characteristics of bike stations and the distance between bike stations and other amenities are examined by the bike-sharing system dashboard. The evaluation findings can be used to enhance the public bike-sharing service.
NFR-5	Availability	The bicycle-sharing programme is a form of shared transportation in which people can rent bicycles at a reasonable cost for a limited amount of time. CitiBike offers two different kinds of docking systems: docking systems, which allow customers to borrow a bike from one dock and return it to another port within the system; and dockless systems, which are node-free and depend on smart technology. Both forms can use smartphone online mapping to find close-by ports and bikes that are available.
NFR-6	Scalability	Urban inhabitants can immediately get access to bike-sharing programmes, which may make the transportation system more dependable. The programme can be expanded to include locations that are now unreachable by this type of transportation, as well as cities other than New York City, if the necessary data is available and obtained.  This research will eventually be able to give a more in-depth picture of how bike-sharing functions in emergency situations as additional data becomes available, particularly in other cities with comparable extensive bike-sharing systems.

## 5. PROJECT DESIGN

### 5.1 Data Flow Diagram

User Type	Functional Requirement (Epic)	User Story Number	User Story / Task	Acceptance criteria	Priority	Release
Customer, Analysts, Organizations, Government	Collection of user data	USN-1	Lyft citi bike's official website provides the data to help with analysis, development, visualization etc. Data is collected from these published files.	I can access the data on Lyft citi bike's official website	High	Sprint-1
Customer, Analysts, Organizations, Government	Analysing the user data	USN-2	This data is used as input for creating various types of visualizations and analysis	I can view the analysis of the citi bike	High	Sprint-1

User Type	Functional Requirement (Epic)	User Story Number	User Story / Task	Acceptance criteria	Priority	Release
Customer, Analysts, Organizations, Government	Collection of user data	USN-1	Lyft citi bike's official website provides the data to help with analysis, development, visualization etc. Data is collected from these published files.	I can access the data on Lyft citi bike's official website	High	Sprint-1

## **5.2 Solution & Technical Architecture**

Table-1 :Components & Technologies:

S.No	Component	Description	Technology
1.	User Interface	User can Interact with web Application	HTML, CSS, JavaScript .
2.	Data Pre processing	Pre processing of data should be done	Python
3.	Feature Engineering	Feature engineering of Dataset by adding new values to the existing dataset.	Python
4.	Exploratory Data Analysis	Exploring the data using boxplot, pie plot, scatter plot etc..	Python
5.	Model Building	Build the model using machine learning algorithm	python
6.	Data Storage	Database Service on Cloud	IBM DB2, IBM Cloudant etc.
7.	User Interface	Dashboard showing the details of the trip duration, no of trips, bike usage etc..	HTML,CSS, JavaScript.

Table-2: Application Characteristics:

S.No	Characteristics	Description	Technology
1.	Security Implementations	The main security concern is for users account hence proper login mechanism should be used to avoid hacking.	e.g. SHA-256, Encryptions, IAM Controls, OWASP etc.
2.	Availability	The system shall be available 24 hours a day 7 days a week. User can access at anytime	
3.	Performance	The system should require a fair amount of speed especially while browsing through the catalogue	

## 5.3 User Stories

## 6. PROJECT PLANNING & SCHEDULING

### 6.1 Sprint Planning & Estimation

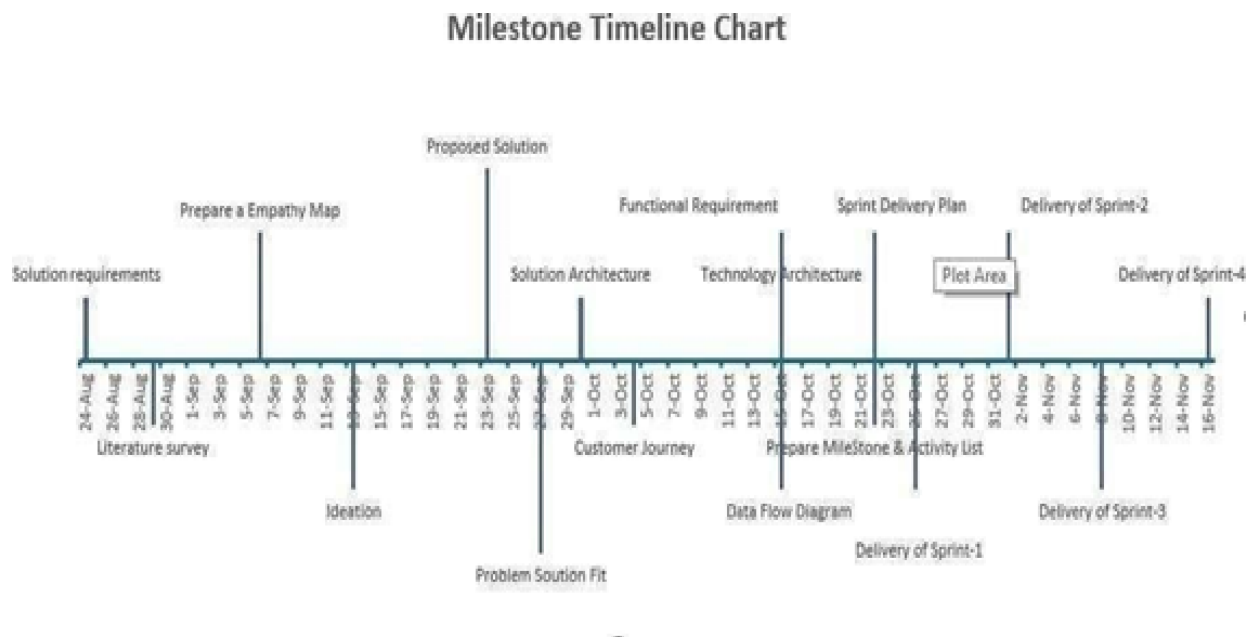

Sprint	Functional Requirement (Epic)	User Story Number	User Story / Task	Story Points	Priority	Team Members
Sprint-1	Data preparation	USN-1	As an analyst, I can extract the Citi bike dataset for the year 2018.	5	High	Ramnath, Jeyanth
Sprint-1		USN-2	As an analyst, I upload the dataset into Cognos platform.	6	High	Vignesh Vasanth
Sprint-1	Data Cleaning	USN-3	As an analyst, I remove the null and duplicate values.	4	Medium	Jeyanth, Vignesh
Sprint-1		USN-4	As an analyst, I identify patterns and relationships between the various attributes	5	High	Ramnath, Vasanth
Sprint-2	Feature Engineering	USN-5	I made computations on the different attribute to find the new attribute value.	4	Medium	Ramnath, Jeyanth

Sprint	Functional Requirement (Epic)	User Story Number	User Story / Task	Story Points	Priority	Team Members
Sprint-2		USN-6	I have dropped few attributes from the data set which are not needed.	6	High	Vignesh, Vasanth
Sprint-2	Visualization	USN-7	As an analyst, I visualize the data and infer the knowledge in Cognos platform.	10	High	Ramnath, Vasanth
Sprint-3		USN-8	As an analyst, I made visualization charts of the data using python	10	High	Vignesh, Jeyanth
Sprint-3	Dashboard	USN-9	As an analyst, I create a dashboard with the created visualizations to supplement business insights during the decision-making process at Citi dataset.	10	High	Ramnath, Jeyanth
Sprint-4	Prediction	USN-10	To predict the most common user type ie customers and subscribers using various machine learning algorithms.	10	High	Vignesh, Vasanth
Sprint-4	Registration	USN-11	As a user, I can register and login in the application.	10	High	Ramnath, Vasanth

Sprint	Total Story Points	Duration	Sprint Start Date	Sprint End Date (Planned)	Story Points Completed	Sprint Release Date (Actual)
Sprint-1	20	6 days	24 Oct	29 Oct 2022	20	29 Oct

			2022			2022
Sprint-2	20	6 days	31 Oct 2022	05 Nov 2022	20	05 Nov 2022
Sprint-3	20	6 days	07 Nov 2022	12 Nov 2022	20	12 Nov 2022
Sprint-4	20	6 days	14 Nov 2022	19 Nov 2022	20	19 Nov 2022

## 6.2 Sprint Delivery Schedule

## 7. WORKING WITH THE DATASET & DATA VISUALISATION

### 7.1 Understanding the dataset

tripduration	starttime	stoptime	start station	start station latitude	start station longitude	end station	end station latitude	end station longitude	bikeid	usertype	birth year	gender
695	01-06-2013 00:00:01	01-06-2013 00:11:36	444 Broadway	40.74235	-73.9892	434 9 Ave & W	40.74317	-74.0037	19678	Subscriber	1983	1

## Dataset Link: Dataset

1. Trip Duration: How long a trip lasted in seconds
  2. Start Date and Time: EX->01-06-2013 00:00:01
  3. Stop Date and Time: EX->01-06-2013 00:11:36
  4. Start Station ID: Unique identifier for each station
  5. Start Station Name
  6. Start Station Latitude: Coordinates
  7. Start Station Longitude: Coordinates
  8. End Station ID: Unique identifier for each station
  9. End Station Name
  10. End Station Latitude
  11. End Station Longitude
  12. Bike ID: Unique identifier for each bike
  13. User Type (Customer = 24-hour pass or 3-day pass user; Subscriber = Annual Member):  
Customers are usually tourists, subscribers are usually NYC residents
  14. Year of Birth: Self-entered, not validated by an ID
- Gender (Zero=unknown; 1=male; 2=female): Usually unknown for customers since they often sign up at a kiosk

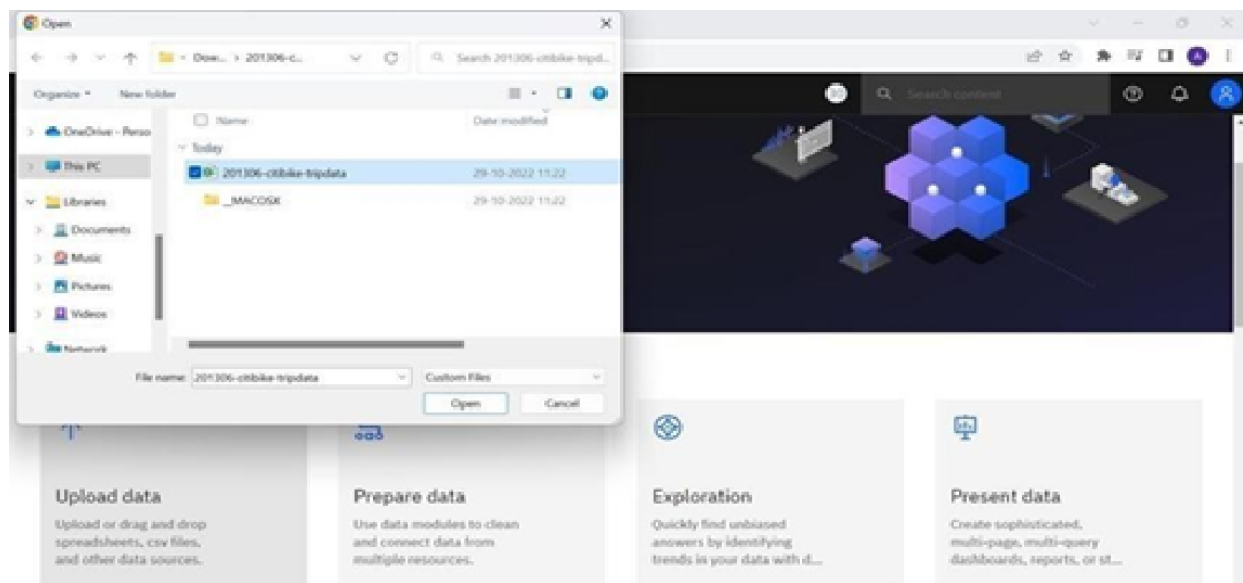

## 7.2 Loading the dataset

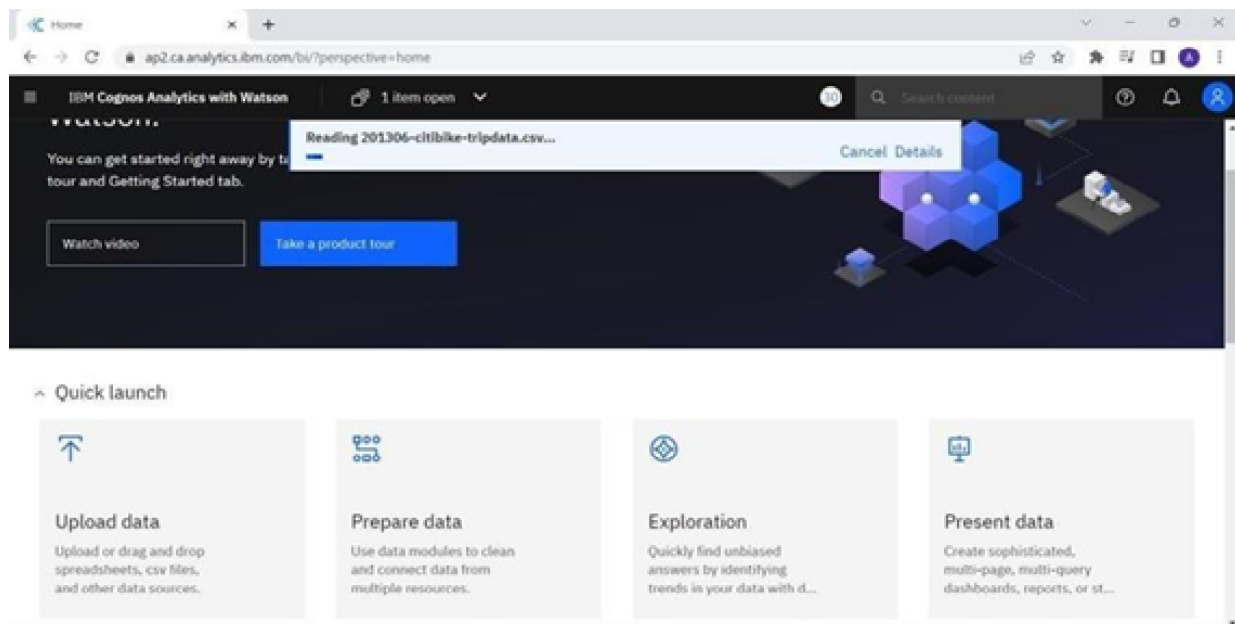

Open Cognos Analytics and click upload data

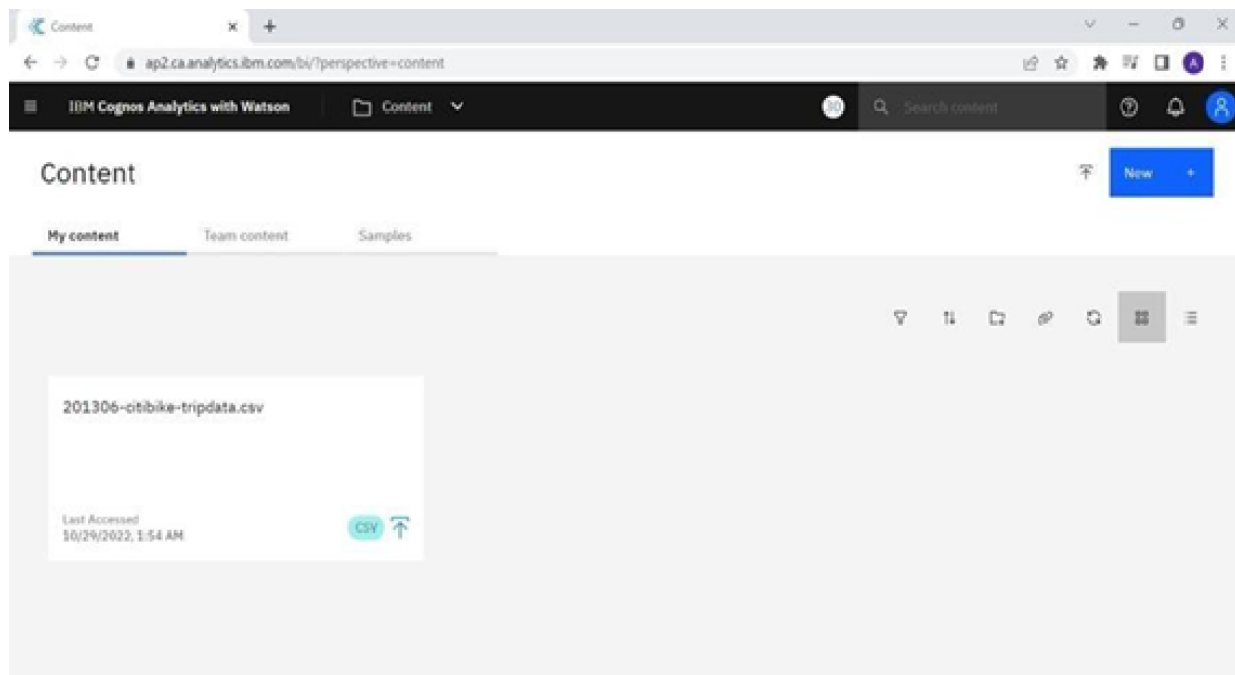

Select the dataset to be uploaded

The excel file is getting uploaded in Cognos Analytics

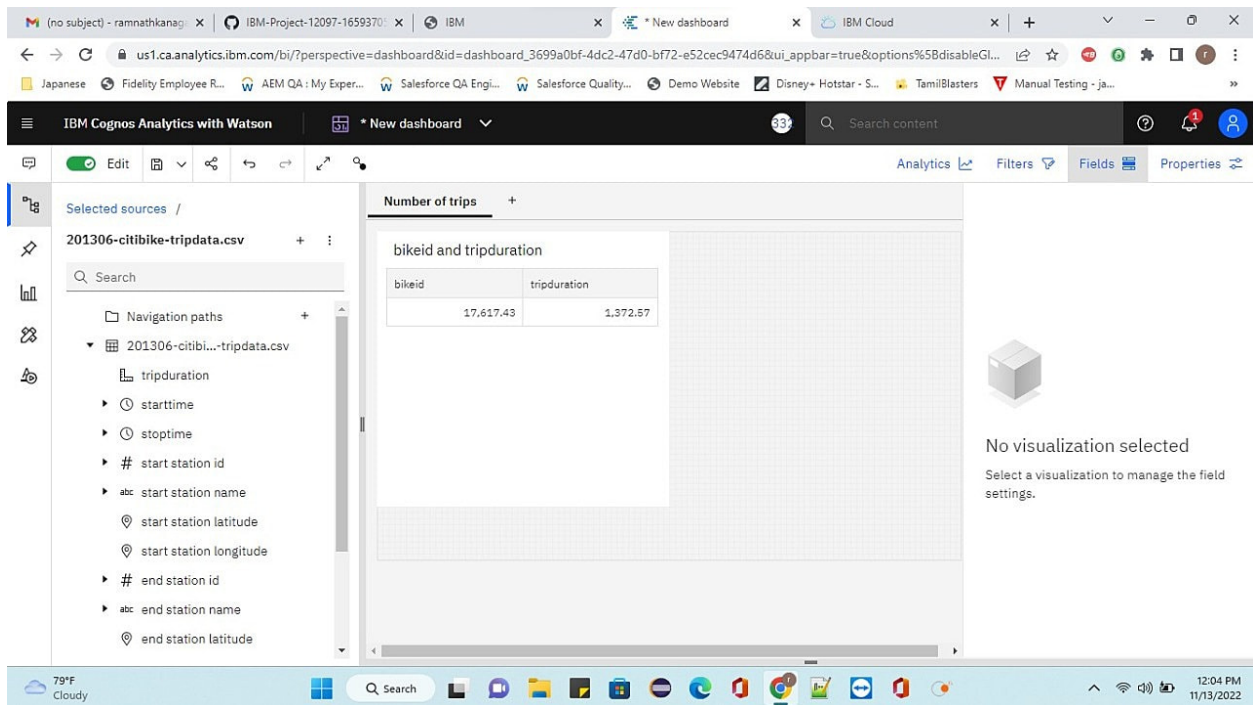

The dataset can be accessed in My Content in Cognos Analytics

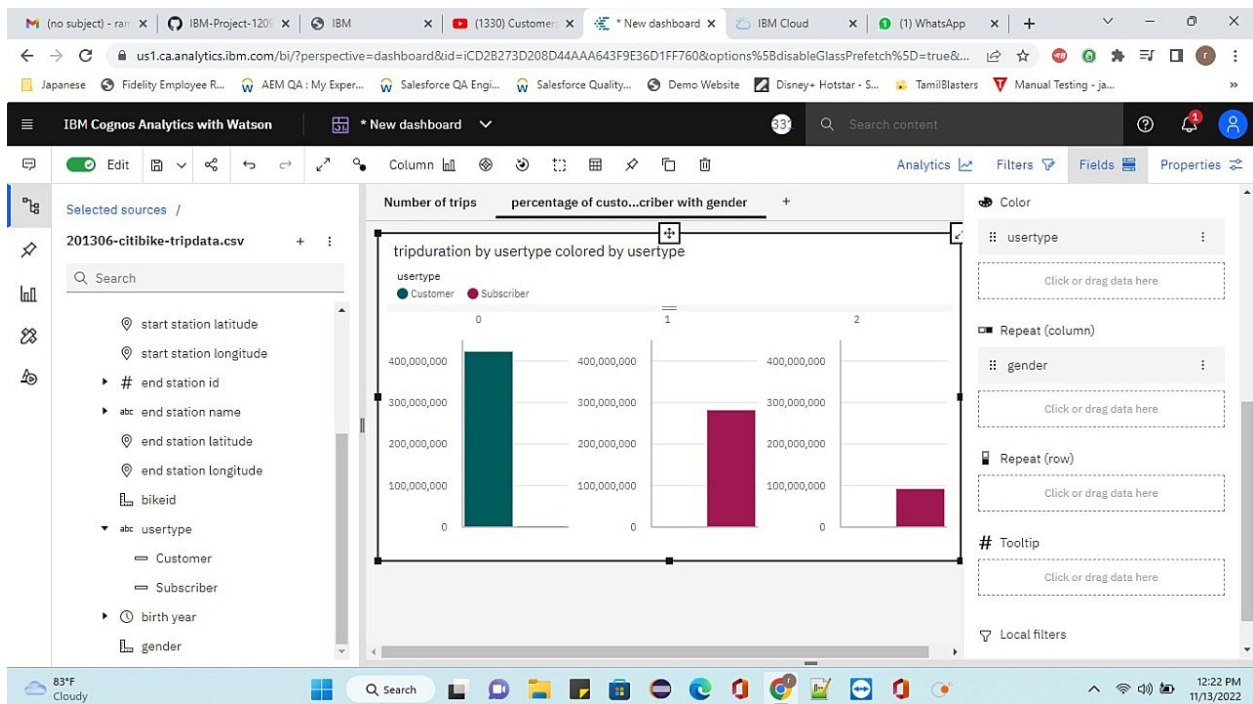

## 7.3 Visualization charts

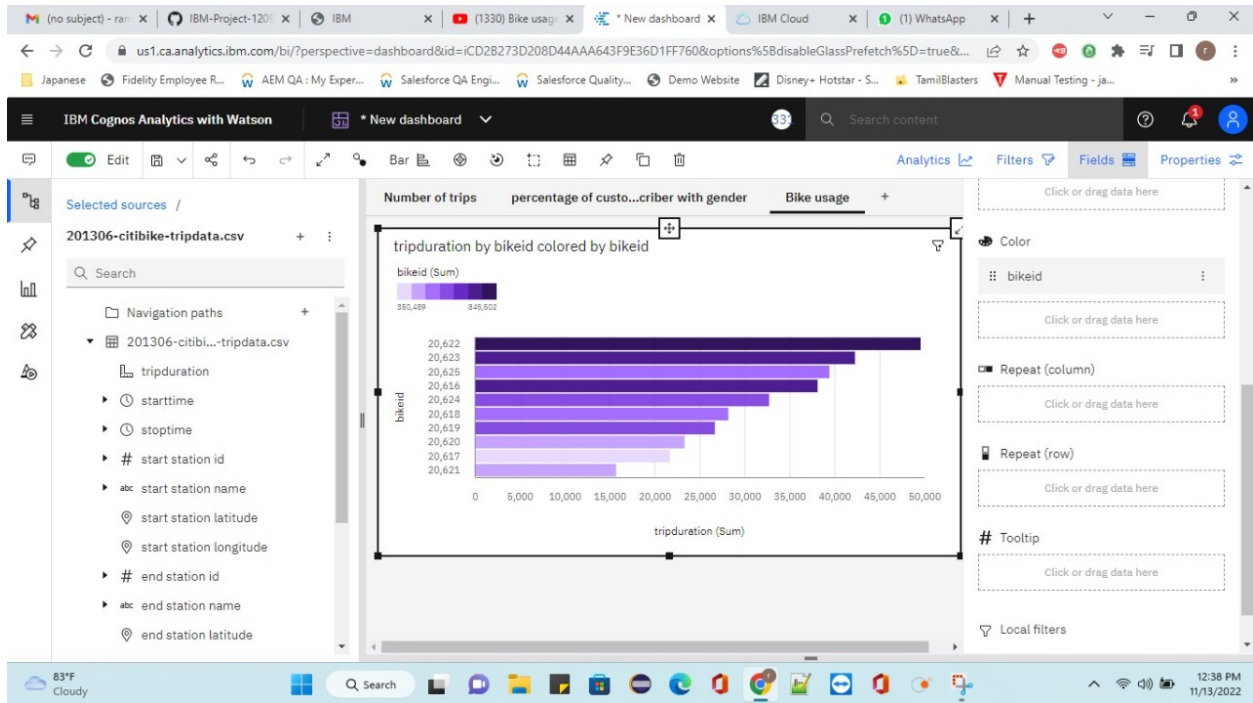

Number of Trips:

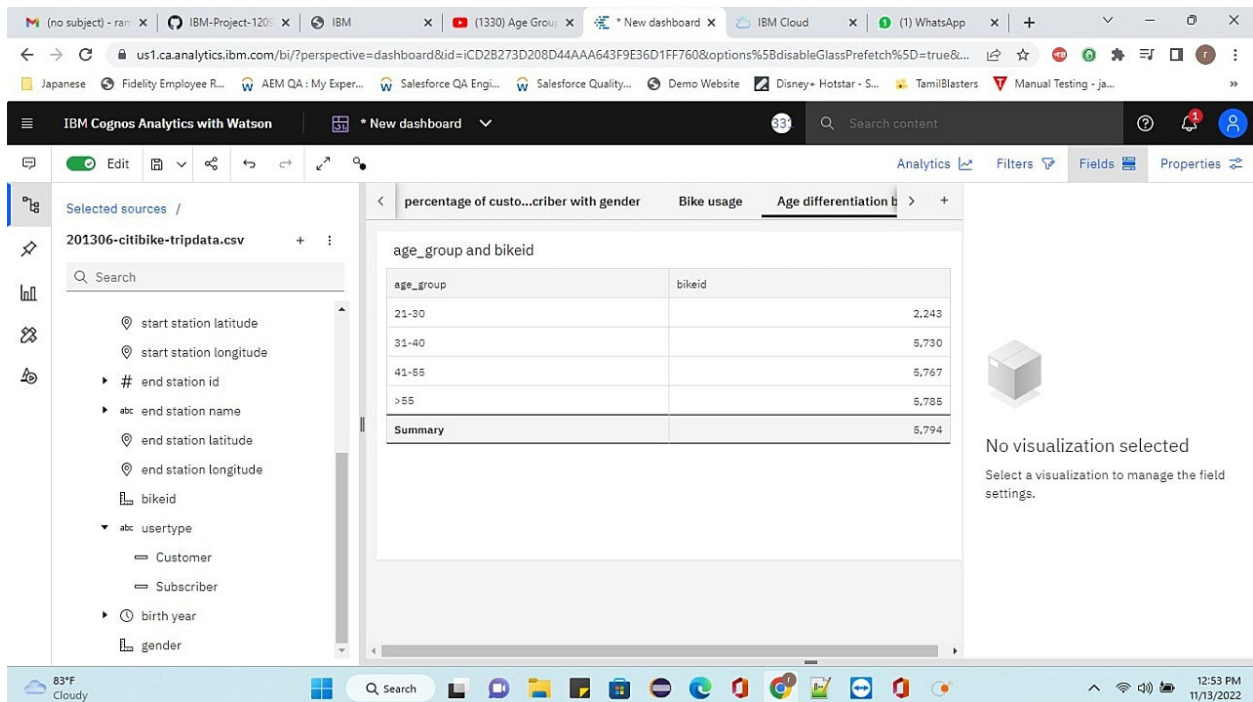

## Customer and Subscriber with Gender:

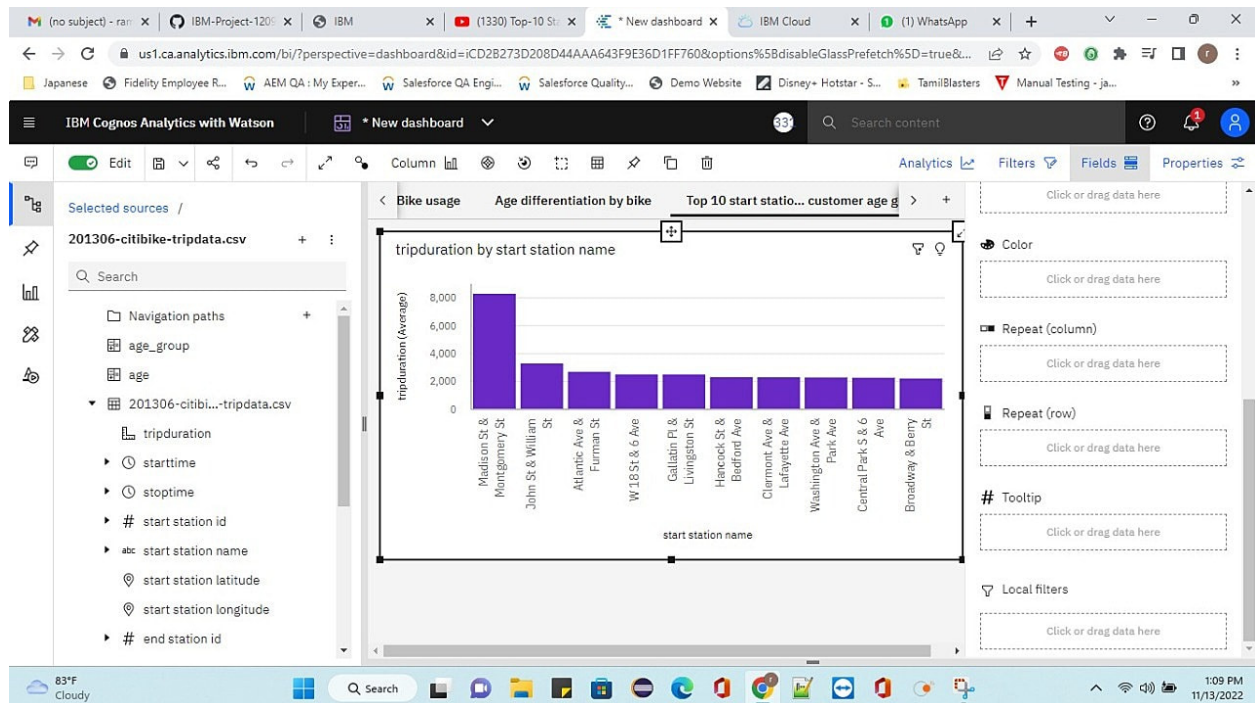

## Bike Usage:

Age group differentiation by bike:

Top 10 Start Station Names with Respect to Customer Age Group:

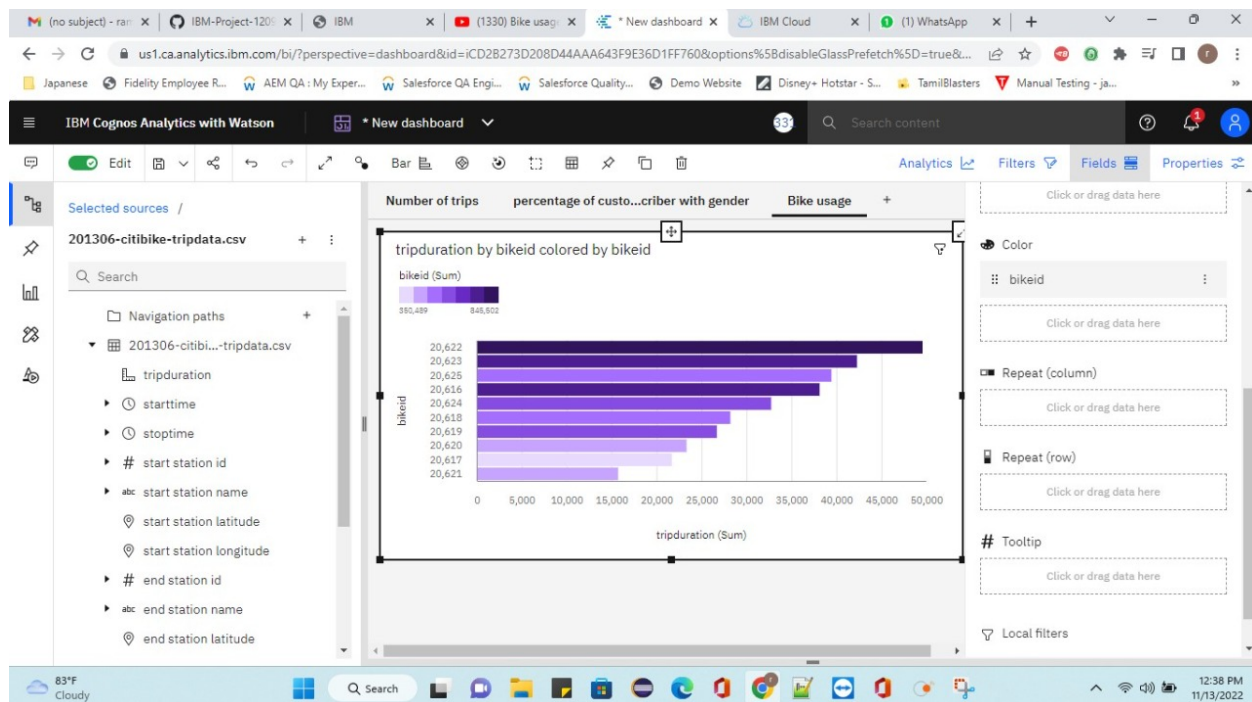

Gender Variation

## 8. CREATING THE DASHBOARD

## 9. ADVANTAGES AND DISADVANTAGES

The benefits of bike sharing schemes include transport flexibility, reductions to vehicle emissions, health benefits, reduced congestion and fuel consumption, and financial savings for individuals.

One can easily analyze and understand trends in bike sharing patterns with the created dashboard. With no prior skills and knowledge about the tools that we use for analysis, anyone (literate or illiterate) can easily infer the knowledge that we represent in various charts or graphs or maps. So that it would be helpful to users and companies to make appropriate decisions in the future.

## 10. CONCLUSION

Based on the quantitative as well as visual analysis of the New York bike share system, a number of interesting insights were gained.

One obvious conclusion was that there is a strong seasonal variation in the system usage with maximum usage in summer and minimum usage in winter. This was initially hypothesized because of the harshness of New York's harsh winters and the treacherous riding conditions that exist during that time. However, despite the adverse weather conditions, there is a strong core demographic that consistently uses the system. This conclusion is based on that fact that even during the months of January and February

which are the peak winter months, there are more than two hundred thousand trips in the system.

New York has a strong public transit system, and the bike share system seems to

complement it quite well with a majority of the highest used stations located either close to subway lines or the commuter rail stations in the city.

Based on the locations of the stations and the duration of trips, it can be hypothesized that bike shares are replacing last mile trips that would otherwise be done either on foot or on public transit. This is particularly true in case of New York where a combination of dense public transit network, the road congestion during peak hours and the average trip distance as calculated create a situation where the only potential trips that the bike share system is replacing currently are those that would otherwise have been undertaken either on foot or on public bus.

## 11. FUTURE SCOPE

NYC is a very crowded and happening place which leads to lots of pollution. And in this busy world people are always worried about transportation this bike sharing system reduces that stress. With increase in population pollution also increases. So it is in our hands to reduce pollution and to make a better future for our younger generations. We can analyze which station needs more bikes and any area needs new station to be installed. The survey outcomes indicates the needs for improved techniques in bike sharing analytics. There exists a lot of scope in this research area.
